

Simple Explanation of How WhatsQuery Works

A plain-English overview of how WhatsQuery connects phone calls, WhatsApp messages, AI receptionist workflows, customer records, and business dashboards.

Bridging the gap between carrier networks and enterprise databases.

Prepared for telecom and data center discussions

Product areas: WhatsQuery Voice and WhatsQuery ERP

Note: This document avoids provider-specific naming and explains the system at a business level.

1. What is WhatsQuery?

WhatsQuery is a business communication and automation platform. It helps businesses manage customer calls, WhatsApp messages, leads, orders, appointments, and business records from one dashboard.

For a common business owner, WhatsQuery acts like a smart front desk. It can answer customers, collect details, record conversations, create follow-up tasks, and show all activity in a simple dashboard.

In simple words: a customer contacts a business, WhatsQuery understands the request, records the important information, and shows it to the business team.

Simple Product Flow

Customer
calls or
sends
WhatsApp
message

WhatsQuery
AI
receptionist
responds

Lead, order,
booking, or
call log is
saved

Business
sees
everything
in
dashboard

2. Why Telecom Operators Matter

WhatsQuery Voice needs reliable telecom connectivity for business phone calls. A telecom partner can provide SIP trunks, local phone numbers, call routing, and local network support.

WhatsQuery adds the business software layer on top of telecom connectivity. Together, the telco provides the reliable communication network, and WhatsQuery provides the customer-facing automation and business dashboard.

Telecom Partner Provides

SIP trunk, local numbers, call routing, network reliability, CDR support, and hosting/data center options.

WhatsQuery Provides

AI receptionist, customer records, lead capture, dashboard, reports, WhatsApp channel, and business workflows.

3. Main Parts of WhatsQuery

WhatsQuery is made of simple parts that work together. Each part has a clear role.

Phone Call Layer

Receives business calls through SIP/telecom routing and sends them to the right business AI receptionist.

WhatsApp Layer

Receives customer WhatsApp messages and stores conversations under the correct business account.

AI Receptionist

Answers common questions, asks follow-up questions, and collects useful details from customers.

Business Dashboard

Shows calls, messages, leads, orders, appointments, recordings where enabled, and reports.

Database

Stores business profiles, users, customer activity, call logs, messages, and usage records.

Admin Center

Allows WhatsQuery team to monitor tenants, troubleshoot issues, review usage, and support customers.

4. How a Phone Call Works

When a customer calls a business number, the telecom network sends the call to WhatsQuery through SIP routing. WhatsQuery identifies which business owns that number and starts the correct AI receptionist.

Example

A customer calls a restaurant and asks, "Can I book a table for 4 people tonight?"

WhatsQuery can collect the customer name, phone number, requested time, and party size. The system saves this as a table request for staff to confirm.

What Gets Saved?

- Caller number
- Call time and duration
- Call summary
- Lead, order, or booking request if applicable
- Recording link if recording is enabled and allowed

5. How a WhatsApp Message Works

Many Pakistani businesses rely heavily on WhatsApp. WhatsQuery treats WhatsApp as a full customer service channel, not just a notification tool.

Important Safety Rule

WhatsQuery never uses one business's data to answer another business's customer. Every message is matched to the correct business account before any response is prepared.

Example

A customer messages a cafe: "Are you open today and can I order takeaway?"

WhatsQuery checks the cafe's business hours and order rules, replies with available information, and asks for customer details if the team needs to confirm the order.

6. How the AI Receptionist Knows What to Say

The AI receptionist does not guess business facts. Each business trains it using its own information.

What the AI Must Not Invent

- Exact prices unless configured
- Discounts unless configured
- Confirmed availability unless backend/staff confirms
- Medical, legal, or financial advice
- Refund policy if not configured
- Services or menu items not provided by the business

7. Business Dashboard

The dashboard gives the business owner and staff one place to see what happened with customers.

Dashboard Area	What It Shows
Calls	Caller number, call status, duration, summary, and recording option if enabled.
WhatsApp Inbox	Customer conversations, AI replies, failed messages, and handoff requests.
Leads	Name, phone, reason for contact, status, and notes.
Orders	Takeaway/order requests captured by the AI receptionist.
Reservations	Table bookings or appointment requests needing staff confirmation.
Usage	Calls, minutes, messages, assistant usage, and package limits.

The goal is simple: the business should never lose a customer request just because staff were busy.

8. Data Separation and Privacy

WhatsQuery is designed for many businesses to use the same platform safely. Each business has its own account and its own data area.

Plain-English Security Controls

- Users must log in.
- Users can only see their own business account.
- Staff roles can be limited.
- Admin-only areas are not visible to normal tenants.
- Integration secrets are not shown back to users.
- Backups and monitoring are planned for production safety.

9. Hosting and Pakistan Data Residency

For telecom production, WhatsQuery can host production workloads inside Pakistan. This can be done using a telco-approved cloud/data center, a Pakistan-based cloud/VPS provider, or colocated WhatsQuery-owned servers.

PAKISTAN PRODUCTION

Customer records

Call logs

WhatsApp conversations

TELECOM LAYER

SIP trunk

Asterisk / call routing

Static IP whitelist

Simple Recommendation

Keep production telecom data, call records, and customer operational data inside Pakistan if required by the telecom partner or local compliance expectations.

10. What We Need from the Telecom Partner

To connect WhatsQuery Voice with telecom calling, we need SIP trunking and related technical information.

Requirement	Why It Is Needed
SIP trunk	To route customer phone calls into WhatsQuery.
Local numbers / DIDs	To assign business phone numbers to customers.
Concurrent channels	To decide how many calls can happen at the same time.
Static IP whitelisting	To secure SIP traffic between telco and WhatsQuery.
Codec and RTP details	To make audio work correctly.
CDR access	To reconcile call duration, billing, and usage records.
SLA and support path	To resolve production calling issues quickly.
Hosting/data center option	To keep production telecom workloads inside Pakistan if required.

11. Pilot Plan

We recommend starting with a controlled pilot before large-scale production. The pilot can include a cafe with 2 branches and a restaurant with 4 branches.

What Success Looks Like

- Calls reach the correct business AI receptionist.
- WhatsApp messages appear under the correct business.
- Leads, orders, and booking requests are captured.
- No business can see another business's data.
- Call logs and message logs are accurate.
- Backups and monitoring are working.

12. Final Summary

WhatsQuery helps businesses handle customer communication more professionally. It connects telecom calls, WhatsApp messages, AI assistance, customer records, and business dashboards.

For Businesses

Fewer missed customers, better follow-up, organized leads, and easier daily operations.

For Telecom Partner

A value-added business communication platform that can sit on top of SIP trunks and local numbers.

For Customers

Faster answers, easier ordering or booking, and better support through phone or WhatsApp.

For Production

Can be hosted inside Pakistan using telco cloud, local VPS/cloud, or colocated infrastructure.

WhatsQuery is built to be simple for business owners, useful for customers, and flexible enough for telecom-grade deployment.
